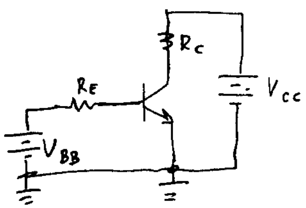
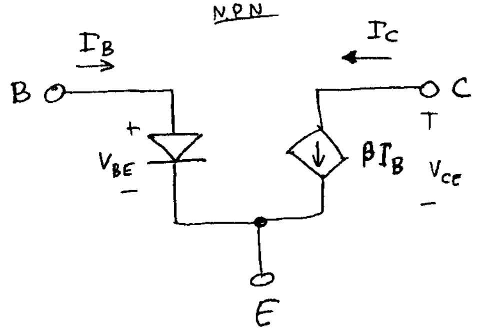
3.2 DC Analysis of Transistor Circuits

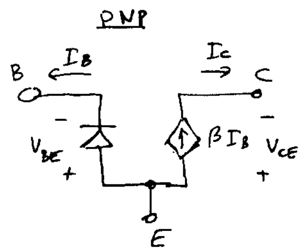
3.2.1 Common Emitter Circuit.



What are voltages and currents?

Equivalent circuit of transistor: (Model)





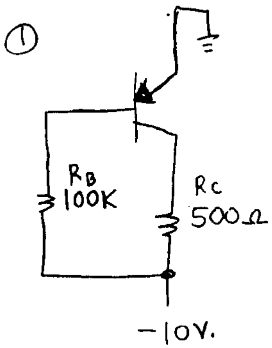
Substitute the model for the transistor, and analyze.

Example:

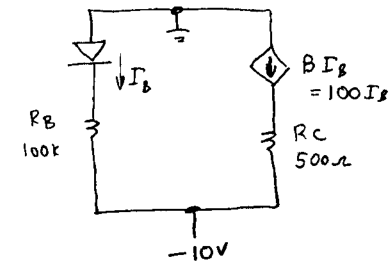
Transistor parameters:

$V_{BE} = .6 \qquad \beta = 100$

①



=



$V_{RB} = 9.4 \qquad I_B = \frac{9.4}{100k} = .094\,ma$

$I_C = \beta I_B = 9.4\,ma$

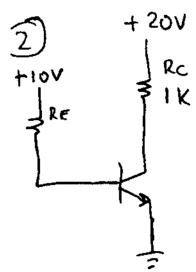
$V_{RC} = I_C R = (9.4\,ma)(500) = 4.7$

$V_{CE} = (-10) - (-4.7) = -5.3\,V$

HW: Do again for $\beta = 50, 200, 500$

---

②

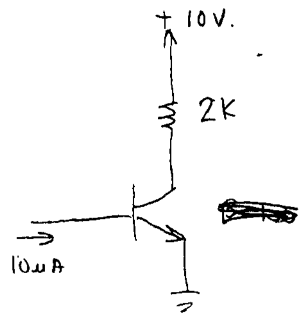


$V_{BE} = .6 \qquad \beta = 100$

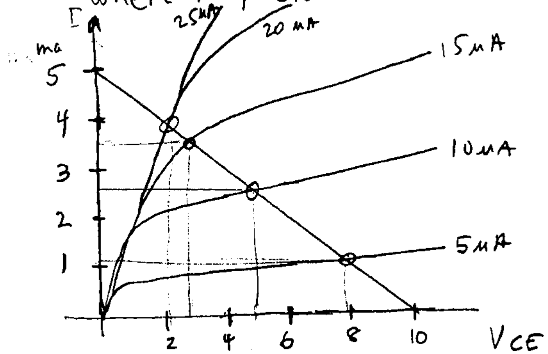
What is R_E for $V_{CE} = 10$?

Load line analysis of transistor circuit

Like a diode



Plot transistor curve and load line on same graph.
Where they cross - - -



Transistor : I_C vs. V_{CE}

Resistor I vs V_{CE} ← $V_{CE} + V_R = 10$

so $V_{CE} = 10 - V_R$

Resistor:

V_R	I	V_{CE}
0	0	10
10	5ma	0

plot this

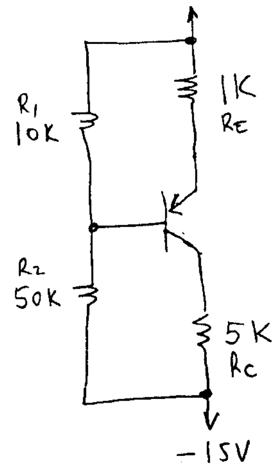
From graph:

I_B	V_{CE}	I_C
10uA	4.9	2.6
5uA	1.1	7.9
15uA	2.8	3.6
20uA	2.1	4.0
25uA	2.1	4.0

} saturation.

Real saturation voltage ≈ .2

Another circuit — Biasing a transistor amplifier



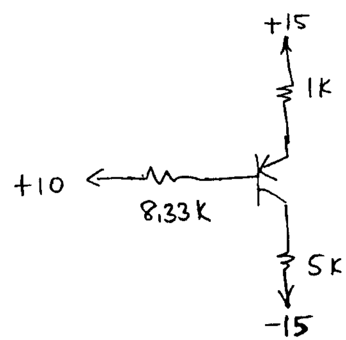
Find operating point.

$\beta = 50 \qquad V_{BE} = .6$

Make Thevenin equivalent of base circuit.

$\frac{R_1}{R_1+R_2} = \frac{V_{R1}}{V_{total}}$

$\frac{10K}{60K} = \frac{V_{R1}}{30}$



←

$V_{R1} = \frac{10K}{60K} \times 30 = \frac{30}{6} = 5$

$V_{R2} = 25$

$V_B = 10$

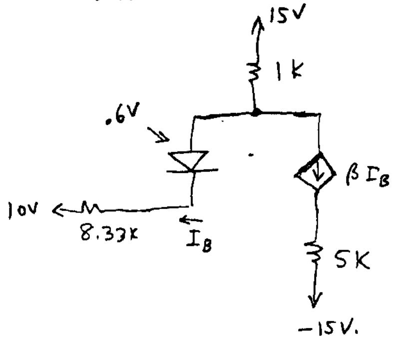
$R = R_1 \| R_2 = \frac{(10K)(50K)}{10K+50K}$

$= \frac{500\,Meg}{60K}$

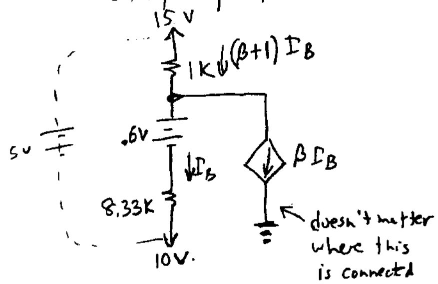
$= \frac{50}{6}K$

$= 8.33K$

Substitute the model.



Simplify it



Loop equation.

$$(1K)(\beta+1)(I_B) + .6 + (8.33K)(I_B) = 5$$

$$(51K)(I_B) + .6 + (8.33K) I_B = 5$$

$$(59.33K) I_B = 4.4$$

$$I_B = \frac{4.4}{59.33K} = 7.4 \times 10^{-5}$$

$$= 74 \ \mu A$$

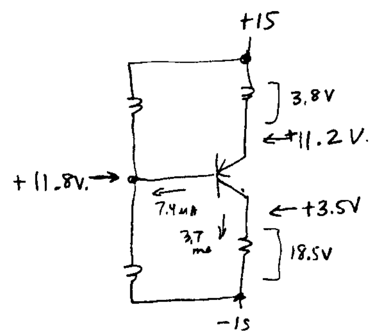
$I_C = \beta I_B = .0037$ A

$V_{RC} = I R = (.0037)(5000) = 18.5$

$I_E = (\beta+1) I_B = .0038$ A

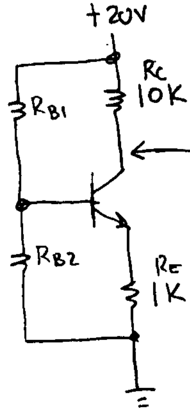
$V_{RE} = (.0038)(1000) = 3.8$

7C 5



Circuit with Q point.

7C 6



Choose R_{B1}, R_{B2} to get 10V. here

$\beta = \infty \qquad V_{BE} = .6$

$$I_C = \frac{V_{RC}}{R_C} = 1 \text{ ma}$$

$I_E \approx 1$ ma

$V_E = V_{RE} = (1\text{ ma})(1K) = 1$

$V_B = V_E + V_{BE} = 1 + .6 = 1.6$

Choose R_{B1}, R_{B2} for 1.6V at junction.

How about -- $R_{B1} = 16K \quad (I = .1 \text{ ma})$

$$R_{B2} = \frac{20-1.6}{.1\text{ ma}} = \frac{18.4}{.1\text{ ma}} = 184K$$

Any resistors in this ratio will work.
The higher the better, but
You need to account for base current.

Same circuit —
$10V < V_C < 11 V.$

$\beta > 50 \qquad V_{BE} = .6$

↑ could be infinite

Observe -- Base current makes V_B go <u>down</u>

which makes V_E go down

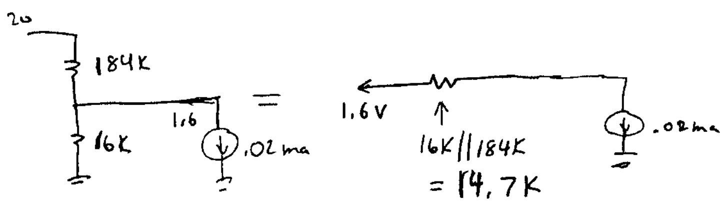
and V_C go up.

(7C 7)

Analyze for $\beta = 50 \qquad (\alpha = \frac{50}{51} = .98)$

If $I_C = 1ma$, $\quad I_B = .02$ ma

Base resistors equivalent circuit



$V=IR \Rightarrow (.02ma)(14.7K)$

$= .3 V.$

$V_{RE} = 1.3 - .6 = .7$

$I_E \quad I_{RE} = \frac{V}{R} = \frac{.7}{1K} = .7ma$

$I_C = \alpha I_E = (.98)(.7 ma) \approx .7$ ma ← close enough

$V_{RC} = (.7ma)(10K) = 7$ volts.

$V_C = 13V.$ ← out of spec!

How to figure R_{B1}, R_{B2} correctly

(7C 8)

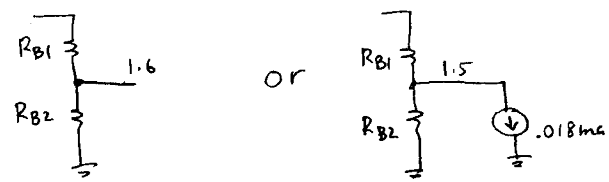
$\beta = \infty \qquad V_C = 10, \ V_E = 1$

$\beta = 50 \qquad V_C = 11, \ V_E = .9$

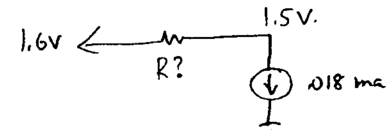
Need base voltage: 1.6 with $\beta = \infty$, $I_B = 0$

1.5 with $\beta = 50$, $I_B = \frac{.9ma}{50} = .018$ ma

Base resistors equivalent circuit:



↓



$R = \frac{V}{I} = \frac{1.6-1.5}{.018ma} = \frac{.1}{.018 ma} = 5.5556$ K

↑ Value of R_{B1}, R_{B2} in Parallel

To get 1.6V, open circuit

the ratio must be $\frac{R_{B1}}{R_{B2}} = \frac{1.6}{18.4} = \frac{V_{R1}}{V_{R2}}$ $\qquad \frac{18.4}{1.6} = 11.5$

$R_{B2} = 11.5 R_{B1}$

So $\frac{R_{B1} R_{B2}}{R_{B1} + R_{B2}} = 5.56K = \frac{(R_{B1})(11.5 R_{B1})}{R_{B1} + 11.5 R_{B1}} =$

$5.56K = \frac{11.5 R_{B1}^2}{12.5 R_{B1}} = \frac{11.5}{12.5} R_{B1}$

$\rightarrow R_{B1} = (5.56K)\left(\frac{12.5}{11.5}\right) = 6.03K$ (6K)

$R_{B2} = 69$ K
