

Hopefully, the output message resembles the input message.

Input message — What we want to send. (sound)

input transducer — Converts it to an electrical signal
(A microphone, camera, etc.)

Transmitter — Converts it to something that can be sent over the channel.

Channel — carries it to the destination,
possibly not very well.
We need to cope with it.

Receiver — hopefully extracts the information from what we receive over the channel

Output transducer — converts back to what we want to receive (speaker)

Channel — we are stuck with it —

it adds noise + distortion

+ thermal noise.
adjacent channels —
lightning
interference
jamming
etc.

Measure of quality is "SNR" "Signal to noise ratio"

Analog or digital message —

|
continuous.

\ discrete.

audio

coded

Samples of audio as numbers.

Outline -

2

Math background - (ch1, 2 & 3)

(1) Basics — Coding, noise, bandwidth, modulation, radiation.

(2) Signals — Energy, power

Classification — Analog / digital

Periodic / aperiodic

Operations — time shifting,
time scaling
time inversion.

correlation — (how to identify the signal we want,
distinguish it from unwanted)

Fourier series (orthogonal basis functions)

Overview — emphasis on meaning, rather than math

(3) Analysis & Transmission of signals

Fourier analysis.

bandwidth.

convolution

Distortion — Linear
Nonlinear

Filters.

Spectral density

more overview — No coverage of DSP.

(4)

AM -

Concept of modulation, "Carrier", "sidebands"
 modulator circuits (not in book)

Demodulation -

more circuits

Variations - QAM (Quadrature AM)

(phase tricks to overlay signals)

SSB (single sideband)

~~Circuits~~ -
 Why?

how? (90° phase shift??)

"Vestigial" sideband. (TV)

Circuits
 how, why

Detection -

envelope detector

synchronous detection - phase locked loop

~~PLL~~

"Super heterodyne" receiver.

- used for AM -

based on AM, sideband, etc.

Television - (just intro here)

(AM, QAM, etc all together!)

(5) FM -

Freq + phase modulation.

Concent

bandwidth.

Transmitter design

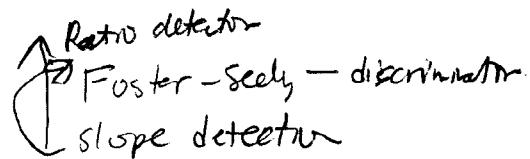

Receiver design.

Generation - Armstrong method
direct.

Advantages &
disadvantages

Transmitter design

Demodulation - Limiter

Phase locked loop
Zero crossing detector

Interference.

pre-emphasis, deemphasis.

FM Stereo

TV sound.

"SCA"

(6)

Pulse code modulation

Sampling, Interpolation, aliasing.

Quantizing.

nonuniform quantiz.

Bandwidth, SNR.

~~Sett~~ for "T1" line.

delta modulation.

(7)

Digital data transmission.

Coding methods.

pulse shaping

scrambling

multi-level

Carrier system — Amplitude shift key

frequency shift key

phase shift key

(circuits)

Demodulation — circuits

multiplexing
